## Chapter 16

## Section 1 Thermochemistry

## Objectives

- Define temperature and state the units in which it is measured. .
- Define heat and state its units.
- Perform specific-heat calculations.
- Explain enthalpy change, enthalpy of reaction, enthalpy of formation, and enthalpy of combustion. v
- Solve problems involving enthalpies of reaction, enthalpies of formation, and enthalpies of combustion.

## Chapter 16

## Thermochemistry

- Virtually every chemical reaction is accompanied by a change in energy. .
- Chemical reactions usually either absorb or release energy as heat. .
- Thermochemistry is the study of the transfers of energy as heat that accompany chemical reactions and physical changes.

## Chapter 16

## Section 1 Thermochemistry

## Heat and Temperature .

- The energy absorbed or released as heat in a chemical or physical change is measured in a calorimeter.
- In one kind of calorimeter, known quantities of reactants are sealed in a reaction chamber that is immersed in a known quantity of water.
- Energy given off by the reaction is absorbed by the water, and the temperature change of the water is measured.
- From the temperature change of the water, it is possible to calculate the energy as heat given off by the reaction.

## Chapter 16

## Section 1 Thermochemistry

## Heat and Temperature, continued .

- Temperature is a measure of the average kinetic energy of the particles in a sample of matter. $v$
- The greater the kinetic energy of the particles in a sample, the hotter it feels. .
- For calculations in thermochemistry, the Celsius and Kelvin temperature scales are used. Celsius and Kelvin temperatures are related by the following equation.

$$
\mathrm{K}=273.15+{ }^{\circ} \mathrm{C}
$$

## Chapter 16

## Heat and Temperature, continued $\downarrow$

- The amount of energy transferred as heat is usually measured in joules. ,
- A joule is the SI unit of heat as well as all other forms of energy.
- Heat can be thought of as the energy transferred between samples of matter because of a difference in their temperatures.
- Energy transferred as heat always moves spontaneously from matter at a higher temperature to matter at a lower temperature.

## Chapter 16

## Section 1 Thermochemistry

## Specific Heat .

- The amount of energy transferred as heat during a temperature change depends on the nature of the material changing temperature, and on its mass. v
- The specific heat of a substance is the amount of energy required to raise the temperature of one gram by one Celsius degree $\left(1^{\circ} \mathrm{C}\right)$ or one kelvin ( 1 K ). .
- The temperature difference as measured in either Celsius degrees or kelvins is the same.

## Chapter 16

## Section 1 Thermochemistry

## Specific Heat, continued

- Values of specific heat are usually given in units of joules per gram per Celsius degree, $\mathrm{J} /\left(\mathrm{g} \cdot{ }^{\circ} \mathrm{C}\right)$, or joules per gram per kelvin, J/(g•K).

## Chapter 16

## Molar Heat Capacities of Elements and Compounds

| Element | $\boldsymbol{C}(\mathbf{J} / \mathbf{K} \bullet m o l)$ | Compound | $\boldsymbol{C}(\mathbf{J} / \mathbf{K} \bullet \mathbf{m o l})$ |
| :--- | :---: | :--- | :---: |
| Aluminum, $\mathrm{Al}(s)$ | 24.2 | Aluminum chloride, $\mathrm{AlCl}_{3}(s)$ | 92.0 |
| Argon, $\mathrm{Ar}(g)$ | 20.8 | Barium chloride, $\mathrm{BaCl}_{2}(s)$ | 75.1 |
| Helium, $\mathrm{He}(g)$ | 20.8 | Cesium iodide, $\mathrm{CsI}(s)$ | 51.8 |
| Iron, $\mathrm{Fe}(s)$ | 25.1 | Octane, $\mathrm{C}_{8} \mathrm{H}_{18}(l)$ | 254.0 |

## Chapter 16

## Section 1 Thermochemistry

## Specific Heat, continued

- Specific heat is calculated according to the equation given below. -

$$
c_{p}=\frac{q}{m \times \Delta T}
$$

- $c_{p}$ is the specific heat at a given pressure, $q$ is the energy lost or gained, $m$ is the mass of the sample, and $\Delta T$ is the difference between the initial and final temperatures. $>$
- The above equation can be rearranged to given an equation that can be used to find the quantity of energy gained or lost with a change of temperature.

$$
q=c_{p} \times m \times \Delta T
$$

Visual Concept

## Chapter 16

## Section 1 Thermochemistry

## Specific Heat, continued

Sample Problem A -
A 4.0 g sample of glass was heated from 274 K to 314 K , a temperature increase of $40 . \mathrm{K}$, and was found to have absorbed 32 J of energy as heat. -
a. What is the specific heat of this type of glass?
b. How much energy will the same glass sample gain when it is heated from 314 K to 344 K ?

## Chapter 16

## Section 1 Thermochemistry

## Specific Heat, continued

Sample Problem A Solution v
Given: $m=4.0 \mathrm{~g}$,

$$
\begin{aligned}
& \Delta T=40 . \mathrm{K} \\
& q=32 \mathrm{~J}
\end{aligned}
$$

Unknown: a. $c_{p}$ in $\mathrm{J} /(\mathrm{g} \cdot \mathrm{K})$.
b. $q$ for $\Delta T$ of $314 \mathrm{~K} \rightarrow 344 \mathrm{~K}$,

Solution:
a. $\quad c_{p}=\frac{q}{m \times \Delta T}=\frac{32 \mathrm{~J}}{(4.0 \mathrm{~g})(40 . \mathrm{K})}=0.20 \mathrm{~J} /(\mathrm{g} \bullet \mathrm{K})$

## Chapter 16

## Specific Heat, continued

## Sample Problem A Solution, continued

## Solution: -

b.

$$
\begin{aligned}
& q=c_{p} \times m \times \Delta T \\
& q=\frac{0.20 \mathrm{~J}}{(\mathrm{~g} \cdot \mathrm{~K})}(4.0 \mathrm{~g})(344 \mathrm{~K}-314 \mathrm{~K}) \\
& q=\frac{0.20 \mathrm{~J}}{(\mathrm{~g} \cdot \mathrm{~K})}(4.0 \mathrm{~g})(30 \mathrm{~K})=24 \mathrm{~J}
\end{aligned}
$$

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction .

- The energy absorbed as heat during a chemical reaction at constant pressure is represented by $\Delta H$. $H$ is the symbol for a quantity called enthalpy. .
- Only changes in enthalpy can be measured. $\Delta H$ is read as "change in enthalpy."
- An enthalpy change is the amount of energy absorbed by a system as heat during a process at constant pressure.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction, continued .

- Enthalpy change is always the difference between the enthalpies of products and reactants.

$$
\Delta H=H_{\text {products }}-H_{\text {reactants }}
$$

- A chemical reaction that releases energy is exothermic, and the energy of the products is less than the energy of the reactants.
- example:

$$
2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+483.6 \mathrm{~kJ}
$$

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction, continued .

$$
2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+483.6 \mathrm{~kJ} \text {. }
$$

- The expression above is an example of a thermochemical equation, an equation that includes the quantity of energy released or absorbed as heat during the reaction as written. .
- Chemical coefficients in a thermochemical equation should be interpreted as numbers of moles and never as numbers of molecules.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction, continued v

- The quantity of energy released is proportional to the quantity of the reactions formed. .
- Producing twice as much water in the equation shown on the previous slide would require twice as many moles of reactants and would release 2 $\times 483.6 \mathrm{~kJ}$ of energy as heat.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction, continued v

- In an endothermic reaction, the products have a higher energy than the reactants, and the reaction absorbs energy. .
- example: ,

$$
2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+483.6 \mathrm{~kJ} \rightarrow 2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})
$$

- The physical states of reactants and products must always be included in thermochemical equations, because the states of reactants and products influence the overall amount of energy exchanged.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction, continued v

- Thermochemical equations are usually written by designating a $\Delta H$ value rather than writing the energy as a reactant or product. .
- For an exothermic reaction, $\Delta H$ is negative because the system loses energy.
- The thermochemical equation for the exothermic reaction previously discussed will look like the following: -

$$
2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \quad \Delta H=-483.6 \mathrm{~kJ}
$$

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction, continued •

Exothermic Reaction Pathway

Course of reaction $\longrightarrow$

- In an exothermic reaction, energy is evolved, or given off, during the reaction; $\Delta H$ is negative.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Reaction, continued v

- In an endothermic reaction, energy is absorbed; in this case, $\Delta H$ is designated as positive.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Formation v

- The molar enthalpy of formation is the enthalpy change that occurs when one mole of a compound is formed from its elements in their standard state at $25^{\circ} \mathrm{C}$ and 1 atm .
- Enthalpies of formation are given for a standard temperature and pressure so that comparisons between compounds are meaningful.
- To signify standard states, a ${ }^{0}$ sign is added to the enthalpy symbol, and the subscript $f$ indicates a standard enthalpy of formation: $\Delta H_{f}^{0}$

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Formation, continued v

- Some standard enthalpies of formation are given in the appendix of your book. v
- Each entry in the table is the enthalpy of formation for the synthesis of one mole of the compound from its elements in their standard states. v
- The thermochemical equation to accompany an enthalpy of formation shows the formation of one mole of the compound from its elements in their standard states.

## Chapter 16

## Section 1 Thermochemistry

## Stability and Enthalpy of Formation .

- Compounds with a large negative enthalpy of formation are very stable. -
- example: the $\Delta H_{f}^{0}$ of carbon dioxide is -393.5 kJ per mol of gas produced. .
- Elements in their standard states are defined as having $\Delta H_{f}^{0}=0$.
- This indicates that carbon dioxide is more stable than the elements from which it was formed.

## Chapter 16

## Section 1 Thermochemistry

## Stability and Enthalpy of Formation, continued

- Compounds with positive values of enthalpies of formation are typically unstable.
- example: hydrogen iodide, HI , has a $\Delta H_{f}^{0}$ of +26.5 kJ/mol. v
- It decomposes at room temperature into violet iodine vapor, $\mathrm{I}_{2}$, and hydrogen, $\mathrm{H}_{2}$.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Combustion v

- The enthalpy change that occurs during the complete combustion of one mole of a substance is called the enthalpy of combustion of the substance.
- Enthalpy of combustion is defined in terms of one mole of reactant, whereas the enthalpy of formation is defined in terms of one mole of product.
- $\Delta H$ with a subscripted $c, \Delta H_{c}$, refers specifically to enthalpy of combustion.

## Chapter 16

## Section 1 Thermochemistry

## Enthalpy of Combustion, continued v

- A combustion calorimeter, shown below, is a common instrument used to determine enthalpies of combustion.

## Chapter 16

## Section 1 Thermochemistry

## Calculating Enthalpies of Reaction .

- The basis for calculating enthalpies of reaction is known as Hess's law: the overall enthalpy change in a reaction is equal to the sum of enthalpy changes for the individual steps in the process.
- This means that the energy difference between reactants and products is independent of the route taken to get from one to the other.

## Chapter 16

## Calculating Enthalpies of Reaction, continued

- If you know the reaction enthalpies of individual steps in an overall reaction, you can calculate the overall enthalpy without having to measure it experimentally. .
- To demonstrate how to apply Hess' s law, we will work through the calculation of the enthalpy of formation for the formation of methane gas, $\mathrm{CH}_{4}$, from its elements, hydrogen gas and solid carbon:

$$
\mathrm{C}(\mathrm{~s})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{CH}_{4}(\mathrm{~g}) \quad \Delta H_{f}^{0}=?
$$

## Chapter 16

## Calculating Enthalpies of Reaction, continued

- The component reactions in this case are the combustion reactions of carbon, hydrogen, and methane: v

$$
\begin{array}{ll}
\mathrm{C}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta H_{c}^{0}=-393.5 \mathrm{~kJ} \\
\mathrm{H}_{2}(\mathrm{~g})+1 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) & \Delta H_{c}^{0}=-285.8 \mathrm{~kJ}
\end{array}
$$

$\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \quad \Delta H_{c}^{0}=-890.8 \mathrm{~kJ}$

## Chapter 16

## Calculating Enthalpies of Reaction, continued

- The overall reaction involves the formation rather than the combustion of methane, so the combustion equation for methane is reversed, and its enthalpy changed from negative to positive: ,

$$
\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(I) \rightarrow \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \quad \Delta H^{0}=+890.8 \mathrm{~kJ}
$$

## Chapter 16

## Calculating Enthalpies of Reaction, continued

- Because 2 moles of water are used as a reactant in the above reaction, 2 moles of water will be needed as a product.
- Therefore, the coefficients for the formation of water reaction, as well as its enthalpy, need to be multiplied by 2 :

$$
2 \mathrm{H}_{2}(g)+\mathrm{O}_{2}(g) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(I) \quad \Delta H_{c}^{0}=2(-285.8 \mathrm{~kJ})
$$

## Chapter 16

## Section 1 Thermochemistry

## Calculating Enthalpies of Reaction, continued

- We are now ready to add the three equations together using Hess's law to give the enthalpy of formation for methane and the balanced equation.

$$
\begin{array}{ll}
\mathrm{C}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta H_{c}^{0}=-393.5 \mathrm{~kJ} \\
2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) & \Delta H_{c}^{0}=2(-285.8 \mathrm{~kJ}) \\
\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) & \Delta H^{0}=-890.8 \mathrm{~kJ}
\end{array}
$$

$$
\mathrm{C}(\mathrm{~s})+2 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow \mathrm{CH}_{4}(\mathrm{~g})
$$

$$
\Delta H_{f}^{0}=-74.3 \mathrm{~kJ}
$$

## Chapter 16

## Section 1 Thermochemistry

## Calculating Enthalpies of Reaction, continued

- Using Hess' s law, any enthalpy of reaction may be calculated using enthalpies of formation for all the substances in the reaction of interest, without knowing anything else about how the reaction occurs. .
- Mathematically, the overall equation for enthalpy change will be in the form of the following equation:
$\Delta H^{0}=\operatorname{sum}$ of $\left[\left(\Delta H_{f}^{0}\right.\right.$ of products $) \times($ mol of products $\left.)\right]$ - sum of [( $\Delta H_{f}^{0}$ of reactants) $\times($ mol of reactants $\left.)\right]$

## Chapter 16

## Calculating Enthalpies of Reaction, continued

## Sample Problem B,

Calculate the enthalpy of reaction for the combustion of nitrogen monoxide gas, NO , to form nitrogen dioxide gas, $\mathrm{NO}_{2}$, as given in the following equation. -

$$
\mathrm{NO}(g)+1 / 2 \mathrm{O}_{2}(g) \rightarrow \mathrm{NO}_{2}(g)_{-}
$$

Use the enthalpy-of-formation data in the appendix. Solve by combining the known thermochemical equations.

## Chapter 16

## Calculating Enthalpies of Reaction, continued

Sample Problem B Solution v
Given:

$$
\begin{array}{ll}
\frac{1}{2} \mathrm{~N}_{2}(g)+\frac{1}{2} \mathrm{O}_{2}(g) \rightarrow \mathrm{NO}(g) & \Delta \mathrm{H}_{\mathrm{f}}^{0}=+90.29 \mathrm{~kJ} \\
\frac{1}{2} \mathrm{~N}_{2}(g)+\mathrm{O}_{2}(g) \rightarrow \mathrm{NO}_{2}(g) & \Delta \mathrm{H}_{\mathrm{f}}^{0}=+33.2 \mathrm{~kJ} \text { v }
\end{array}
$$

Unknown: $\Delta H^{0}$ for $\mathrm{NO}(g)+\frac{1}{2} \mathrm{O}_{2}(g) \rightarrow \mathrm{NO}_{2}(g)$ Solution:
Using Hess' s law, combine the given thermochemical equations in such a way as to obtain the unknown equation, and its $\Delta H^{0}$ value.

## Chapter 16

## Section 1 Thermochemistry

## Calculating Enthalpies of Reaction, continued

Sample Problem B Solution, continued
The desired equation is:

$$
\mathrm{NO}(g)+\frac{1}{2} \mathrm{O}_{2}(g) \rightarrow \mathrm{NO}_{2}(g)
$$

Reversing the first given reaction and its sign yields the following thermochemical equation:

$$
\mathrm{NO}(g) \rightarrow \frac{1}{2} \mathrm{~N}_{2}(g)+\frac{1}{2} \mathrm{O}_{2}(g) \quad \Delta \mathrm{H}_{\mathrm{f}}^{0}=-90.29 \mathrm{~kJ}
$$

The other equation should have $\mathrm{NO}_{2}$ as a product, so we can use the second given equation as is:

$$
\frac{1}{2} \mathrm{~N}_{2}(g)+\mathrm{O}_{2}(g) \rightarrow \mathrm{NO}_{2}(g) \quad \Delta \mathrm{H}_{\mathrm{f}}^{0}=+33.2 \mathrm{~kJ}
$$

## Chapter 16

## Section 1 Thermochemistry

## Calculating Enthalpies of Reaction, continued

Sample Problem B Solution, continued v
We can now add the equations and their $\Delta H^{0}$ values to obtain the unknown $\Delta H^{0}$ value.

$$
\begin{array}{ll}
\mathrm{NO}(g) \rightarrow \frac{1}{2} \mathrm{~N}_{2}(g) t+\frac{1}{2} \mathrm{O}_{2}(\underline{g}) & \Delta H_{\mathrm{f}}^{0}=-90.29 \mathrm{~kJ} \\
\frac{1}{2} \mathrm{~N}_{2}(g)+\mathrm{O}_{2}(g) \rightarrow \mathrm{NO}_{2}(g) & \Delta H_{\mathrm{f}}^{0}=+33.2 \mathrm{~kJ} \\
\hline \mathrm{NO}(g)+\frac{1}{2} \mathrm{O}_{2}(g) \rightarrow \mathrm{NO}_{2}(g) ~ & \Delta H^{0}=-57.1 \mathrm{~kJ}
\end{array}
$$

## Chapter 16

## Section 1 Thermochemistry

## Determining Enthalpy of Formation .

- When carbon is burned in a limited supply of oxygen, carbon monoxide is produced: $\downarrow$

$$
\mathrm{C}(s)+\frac{1}{2} \mathrm{O}_{2}(g) \rightarrow \mathrm{CO}(g)
$$

- The above overall reaction consists of two reactions: v

1) carbon is oxidized to carbon dioxide $\downarrow$
2) carbon dioxide is reduced to give carbon monoxide.

## Chapter 16

## Determining Enthalpy of Formation, continued

- Because these two reactions occur simultaneously, it is not possible to directly measure the enthalpy of formation of $\mathrm{CO}(\mathrm{g})$ from $\mathrm{C}(\mathrm{s})$ and $\mathrm{O}_{2}(\mathrm{~g})$.
- We do know the enthalpy of formation of carbon dioxide and the enthalpy of combustion of carbon monoxide:

$$
\begin{aligned}
\mathrm{C}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta H_{f}^{0}=-393.5 \mathrm{~kJ} / \mathrm{mol} \\
\mathrm{CO}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta H_{c}^{0}=-283.0 \mathrm{~kJ} / \mathrm{mol}
\end{aligned}
$$

## Chapter 16

## Section 1 Thermochemistry

## Determining Enthalpy of Formation, continued

- We reverse the second equation because we need CO as a product. Adding gives the desired enthalpy of formation of carbon monoxide. v

$$
\begin{aligned}
\mathrm{C}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g}) & \Delta H^{0}=-393.5 \mathrm{~kJ} / \mathrm{mol} \\
\mathrm{CO}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) & \Delta H^{0}=+283.0 \mathrm{~kJ} / \mathrm{mol}
\end{aligned}
$$

## Chapter 16

## Section 1 Thermochemistry

## Chapter 16

Section 2 Driving Force of Reactions

## Objectives .

- Explain the relationship between enthalpy change and the tendency of a reaction to occur.
- Explain the relationship between entropy change and the tendency of a reaction to occur. -
- Discuss the concept of free energy, and explain how the value of this quantity is calculated and interpreted.
- Describe the use of free energy change to determine the tendency of a reaction to occur.

## Chapter 16

Section 2 Driving Force of Reactions

## Enthalpy and Reaction Tendency v

- The great majority of chemical reactions in nature are exothermic. .
- The tendency throughout nature is for a reaction to proceed in a direction that leads to a lower energy state. -
- Some endothermic reactions do occur spontaneously. .
- Something other than enthalpy change can help determine whether a reaction will occur.

## Chapter 16

Section 2 Driving Force of Reactions

## Entropy and Reaction Tendency

- Melting is one example of a naturally occurring endothermic process. -
- An ice cube melts spontaneously at room temperature as energy is transferred from the warm air to the ice. -
- The well-ordered arrangement of water molecules in the ice crystal is lost, and the less-ordered liquid phase of higher energy content is formed. .
- A system that can go from one state to another without an enthalpy change does so with an increase in entropy.

## Chapter 16

Section 2 Driving Force of Reactions

## Entropy and Reaction Tendency, continued

- The decomposition of ammonium nitrate:

$$
2 \mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{~s}) \longrightarrow 2 \mathrm{~N}_{2}(g)+4 \mathrm{H}_{2} \mathrm{O}(l)+\mathrm{O}_{2}(g)
$$

- On the left side are 2 mol of solid ammonium nitrate. .
- The right-hand side of the equation shows 3 mol of gaseous molecules plus 4 mol of a liquid.
- The arrangement of particles on the right-hand side of the equation is more random than the arrangement on the left side and hence is less ordered.

## Chapter 16

Section 2 Driving Force of Reactions

## Entropy and Reaction Tendency, continued

- There is a tendency in nature to proceed in a direction that increases the randomness of a system. .
- A random system is one that lacks a regular arrangement of its parts.
- This tendency toward randomness is called entropy. .
- Entropy, S, can be defined in a simple qualitative way as a measure of the degree of randomness of the particles, such as molecules, in a system.

## Chapter 16

Section 2 Driving Force of Reactions

## Entropy and Reaction Tendency, continued .

- To understand the concept of entropy, consider the comparison between particles in solids, liquids, and gases.
- In a solid, the particles are in fixed positions, and we can easily determine the locations of the particles.
- In a liquid, the particles are very close together, but they can move around. Locating an individual particle is more difficult. The system is more random, and the entropy is higher.

## Chapter 16

Section 2 Driving Force of Reactions

## Entropy and Reaction Tendency, continued

- In a gas, the particles are moving rapidly and are far apart. Locating an individual particle is much more difficult, and the system is much more random. The entropy is even higher.

## Chapter 16

Section 2 Driving Force of Reactions

## Entropy and Reaction Tendency, continued .

- Absolute entropy, or standard molar entropy, of substances are recorded in tables and reported in units of $\mathrm{kJ} /(\mathrm{mol} \cdot \mathrm{K})$. .
- Entropy change, which can also be measured, is defined as the difference between the entropy of the products and the reactants. .
- An increase in entropy is represented by a positive value for $\Delta S$, and a decrease in entropy is represented by a negative value for $\Delta S$.

## Chapter 16

Section 2 Driving Force of Reactions

## Free Energy .

- Processes in nature are driven in two directions: toward least enthalpy and toward largest entropy. v
- As a way to predict which factor will dominate for a given system, a function has been defined to relate the enthalpy and entropy factors at a given temperature and pressure. v
- This combined enthalpy-entropy function is called the free energy, $G$, of the system; it is also called Gibbs free energy.

## Chapter 16

## Section 2 Driving Force of

 Reactions
## Free Energy, continued .

- Only the change in free energy can be measured. It can be defined in terms of enthalpy and entropy. .
- At a constant pressure and temperature, the freeenergy change, $\Delta G$, of a system is defined as the difference between the change in enthalpy, $\Delta H$, and the product of the Kelvin temperature and the entropy change, which is defined as $T \Delta S$ :

$$
\Delta G^{0}=\Delta H^{0}-T \Delta S^{0}
$$

## Chapter 16

## Relating Enthalpy and Entropy to Spontaneity

| $\Delta \boldsymbol{H}$ | $\Delta \boldsymbol{S}$ | $\Delta \boldsymbol{G}$ | IS the reaction spontaneous? |
| :--- | :--- | :--- | :--- |
| Negative | positive | negative | yes, at all temperatures |
| Negative | negative | either positive or negative | only if $T<\Delta H / \Delta S$ |
| Positive | positive | either positive or negative | only if $T>\Delta H / \Delta S$ |
| Positive | negative | positive | never |

## Chapter 16

## Free Energy, continued .

$$
\Delta G^{0}=\Delta H^{0}-T \Delta S^{0}
$$

- The expression for free energy change is for substances in their standard states.
- The product $T \Delta S$ and the quantities $\Delta G$ and $\Delta H$ have the same units, usually $\mathrm{kJ} / \mathrm{mol}$. If $\Delta G<0$, the reaction is spontaneous. -
- $\Delta H$ and $\Delta G$ can have positive or negative values. This leads to four possible combinations of terms.

## Sample Problem D .

For the reaction $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{s}) \rightarrow \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{HCl}(\mathrm{g})$, at $298.15 \mathrm{~K}, \Delta H^{0}=176 \mathrm{~kJ} / \mathrm{mol}$ and $\Delta S^{0}=$ $0.285 \mathrm{~kJ} /(\mathrm{mol} \cdot \mathrm{K})$. Calculate $\Delta G^{0}$, and tell whether this reaction is spontaneous in the forward direction at 298.15 K.

## Chapter 16

Section 2 Driving Force of Reactions

## Free Energy, continued

Sample Problem D Solution ,
Given: $\Delta H^{0}=176 \mathrm{~kJ} / \mathrm{mol}$ at 298.15 K .

$$
\Delta S^{0}=0.285 \mathrm{~kJ} /(\mathrm{mol} \cdot \mathrm{~K}) \text { at } 298.15 \mathrm{~K}
$$

Unknown: $\Delta G^{0}$ at 298.15 K .
Solution: The value of $\Delta G^{0}$ can be calculated according to the following equation: ,
$\Delta G^{0}=\Delta H^{0}-T \Delta S^{0}$.
$\Delta G^{0}=176 \mathrm{~kJ} / \mathrm{mol}-298 \mathrm{~K}[0.285 \mathrm{~kJ} /(\mathrm{mol} \cdot \mathrm{K})]$,
$\Delta G^{0}=176 \mathrm{~kJ} / \mathrm{mol}-84.9 \mathrm{~kJ} / \mathrm{mol}$
$\Delta G^{0}=91 \mathrm{~kJ} / \mathrm{mol}$
